

Mibelle Biochemistry launches MossCellTec™ No. 1 which is based on a completely novel anti-aging concept

As we grow older, transport processes into and out of the cell nucleus, the cell's control centre, decrease significantly and important regulation molecules no longer reach the cell's headquarter quickly enough. As a result, cell metabolism becomes slow and the cell can no longer react quickly enough to changing environmental conditions.

Mosses are extremely interesting organisms that are exceptionally resistant. They belong to the oldest land-based organisms and have developed unique strategies against changing environmental conditions. The new MossCellTec™ technology was used to develop the active ingredient MossCellTec™ No. 1, which allows us to use these strategies now for the skin.

Extensive studies have shown MossCellTec™ No. 1 strengthens skin against urban aggressors and climatic changes.

- Enables skin to adapt to environmental changes
- Improves skin moisture, even in stressful conditions
- Refines skin and creates a flawless complexion

MossCellTec™ No. 1 significantly improves the hydration, barrier and homogeneity of the skin after just two weeks and ensures a more resilient skin.
